

**U642B** 

## Interval and Wipe/ Wash Wiper Control IC

#### Description

As a convenience feature of the windshield wiper intermittent and wipe/wash operation are implemented in most of the automobiles. The U642B is the low-cost solution for an accurate timing function control. Wipe/wash mode has priority over interval mode. Interval pause and afterwiping time can be set to fixed values by using resistors in a broad time range. Added value can be provided with an individual, continuous adjustment of the interval pause by a potentiometer which may be built into the stalk. For proper operation it is mandatory to feed the signal of the wiper motor's park switch into U642B.

#### Features

- Interval pause: 4 to 20 s
- Afterwiping time: 2 to 20 s
- Wiper motor's park switch
- Wipe/wash mode priority
- One external capacitor, determines all time sequences
- Relay driver with Z-diode
- Load-dump protected

#### **Pin Description**

| Pin | Symbol | Function                        |
|-----|--------|---------------------------------|
| 1   | GND    | Ground                          |
| 2   | INT    | Interval switch                 |
| 3   | Ct     | Timing capacitor C <sub>2</sub> |
| 4   | Rt     | Afterwiping time resistance     |
| 5   | WASH   | Wipe/Wash switch                |
| 6   | PARK   | Park switch for wiper motor     |
| 7   | OUT    | Relay control output            |
| 8   | Vs     | Supply voltage KI. 15           |

**Block Diagram** 

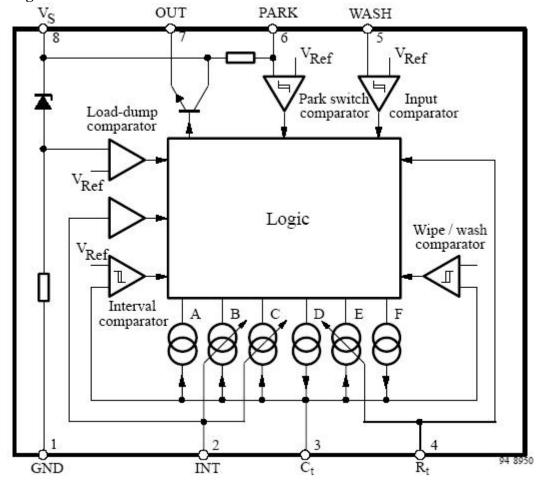

Figure 2. Block diagram

#### **Circuit Description**

#### **Interval Function, Pin 2**

By closing the interval switch, S<sub>2</sub>, to supply voltage, VBatt, the relay is activated. The internal current source (Pin 3) which holds the capacitor C<sub>2</sub> in charged state is switched-off. As soon as there is a positive potential at the park switch (S<sub>1</sub>), the current source F (see figure 2) charges the capacitor C<sub>2</sub> very fast. After the wiper operation is finished, S<sub>1</sub> is again at ground potential, the relay is in "off" position-interval pause begins – the capacitor C<sub>2</sub> is discharged through the current source C, till the voltage at Pin 3 is below the threshold of 2V. Interval pause can be adjusted between 4 s to 20 s with the help of potentiometer R<sub>3</sub>. Now the relay switches on and the next interval cycle begins. Opening of switch S<sub>2</sub> causes the current source A to discharge C<sub>2</sub> immediately and current sources C and F are switched-off.

DANDONG HUAAO ELECTRONICS CO., LTD.

#### Wipe/Wash (WIWA) Operation, Pin 5

By closing the WIWA-switch, S<sub>3</sub>, to supply voltage,  $V_{Batt}$ , the water pump starts spraying water on the windscreen, the current source A is switched-off which keeps the capacitor C<sub>2</sub> in discharged state. Now the capacitor is charged through the current sources D and F, and when after a time interval of proximately 600 ms, the voltage at the capacitor is greater than 6.5V, the relay is turned on as long as the switch "WIWA" is closed.

The after-wipe-time begins after the switch is open whereas the sources D and F are switched off and the source E is activated. Source E discharges the capacitor till the voltage is less than 2.2 V. The relay is off and the wiper-motor is supplied via the park switch until the park position will be reached. The after-wipe-time is determined by the current source E which can be regulated with the external resistor RTime. Afterwards the source A discharges the capacitor. The relay switch off is independent of the park switch S1.

#### **Interval and WIWA Functions**

The interval function is interrupted immediately when the wipe/ wash mode is activated. The current source A discharges the capacitor to a value of 2 V, afterwards the normal wash function starts. Interval wiping starts immediately when the after-wipe time is over. The switching delays are slightly shorter, because the capacitor is already charged to a value of 2 V.

The wipe/ wash function is not interrupted when interval switch S2 is activated. Interval function begins after the WIWA function is over
